This paper examines the impact of corporate social responsibility behavior on the sustainability performance of focal companies and their partners in fast fashion supply chains. The attributes of sustainability and the mechanism of sustainability governance of the fast fashion supply chain are also discussed. From the perspective of strategic corporate social responsibility, we first analyze the motives for adopting sustainability governance in fast fashion supply chains, and identify seven competitive sustainable attributes of the fast fashion product based on sustainable development theory. Then, by establishing a sustainability governance framework, we identify seven factors that affect the sustainability governance decision-making and evaluate the efficiency and legitimacy mechanism of sustainability governance from internal and external perspectives. Finally, we explore the application of the governance mechanisms via a case study based on H&M's seven sustainability commitments. The findings suggest that the core influence and centrality of a corporation should be strengthened from the perspective of internal governance, and stakeholders should collaborate to achieve sustainability governance throughout the entire fast fashion supply chain from the perspective of external governance.
